Projectile Motion Summary

|  | Vertical Projectile | Horizontal Projectile | Parabolic Projectile |
| :---: | :---: | :---: | :---: |
| Picture | $\uparrow$ <br> $\dagger \downarrow$ <br> 1 |  |  |
| Vertical Motion | Free fall in the vertical direction since gravity is pulling in the vertical direction. Acts like an object thrown upward: motion in the vertical direction starts moving upward, slows down, comes to a stop at the maximum height, and speeds up as it falls back toward the Earth. | Free fall in the vertical direction since gravity is pulling in the vertical direction. Acts like an object dropped from rest: motion in the vertical direction starts at rest and speeds up as it falls downward toward the Earth. | Free fall in the vertical direction since gravity is pulling in the vertical direction. Acts like an object thrown upward: motion in the vertical direction starts moving upward, slows down, comes to a stop at the maximum height, and speeds up as it falls back toward the Earth. |
| Horizontal Motion | No horizontal velocity so no horizontal motion. | Constant velocity in the horizontal direction since no horizontal forces. | Constant velocity in the horizontal direction since no horizontal forces. |
| Time of Flight | Depends on initial velocity. <br> More initial velocity $=$ more time | Depends on height launched from only. Does NOT depend on initial velocity. <br> Greater launch height $=$ more time | Depends on the launch angle and the initial velocity. <br> Greater launch angle $=$ more time <br> More initial velocity $=$ more time |
| Range | Zero range since no horizontal motion. | Depends on initial velocity and launch height. <br> More initial velocity $=$ greater range <br> Greater launch height = greater range | Depends on initial velocity and launch angle. <br> More initial velocity $=$ greater range <br> Launch angle of $45^{\circ}$ has maximum range. Above or below that angle, range decreases. Launch angles that are equal amounts off from $45^{\circ}$ (for example, $55^{\circ}$ and $35^{\circ}$ ) will have equal ranges. |
| Maximum Upward Velocity | Occurs at launch. | Never has an upward velocity. | Occurs at launch. |
| Maximum Downward Velocity | Occurs when hits the ground. | Occurs when hits the ground. | Occurs when hits the ground. |
| Maximum Height Reached | Depends on initial velocity. <br> More initial velocity = greater max height | Depends on the launch height. <br> Max height = launch height | Depends on initial velocity and launch angle. <br> More initial velocity $=$ greater max height <br> Greater launch angle $=$ greater max height |
